

Refinery Loss Management System BP Oil International

Reducing costs

BP have demonstrated their ongoing commitment to reducing the cost and impact of hydrocarbon losses from their refineries.

This implementation of Monitor-Web Server has been customised to manage the collection of worldwide refinery losses data and share up to date performance information throughout the organisation.

Intelligent data entry

Business workflow rules have been incorporated into the system. Users are automatically presented with the correct form for their data entry tasks when they log on.

Automatic validation occurs on form submission, ensuring data integrity and completeness.

Improved communication

In a refining operation spanning nine countries from several time zones, the Monitor-Pro system encourages users at remote locations to view and compare their refinery performance against others, thus promoting best practice throughout the business.

Up to date information

KPIs are automatically calculated and instantly updated whenever data is entered into the system. This means that graphs, maps and reports from the website are always current.

Controlling display of information

The system administrator can control and configure the information and chart types that are available to the users.

Information can be simply presented in the most meaningful way, without the confusion of too many options.

Even users with little technical knowledge gain benefit from the site.

David Helks, Hydrocarbon Loss Advisor at BP said, "Users of this site find the clarity of reporting particularly useful. The ability to compare all refineries' performance against targets in one digestible page delivers concise and important information at a glance."
